

1. Illustrative policy-graph snippet (EAU-derived)

2. Resolution of the active node

Radiology specialist

The specialist answers the active graph question using only the evidence assigned to that node.

Information supplied by the orchestrator

- Primary node question**
Is current imaging suspicious or has the lesion grown?
- Current policy context**
Follow-up encounter and previous positive tissue
- Permitted evidence**
Current and previous imaging reports
- Clinical instructions**
relevant thresholds, and worked examples

Supporting assessment questions

Check potential confounding factors or capture details needed to interpret the main verdict.

- What is the PI-RADS category?**
- What is the largest lesion size?**
- Is interval growth documented?**

Allowed verdicts

- low suspicion
- equivocal
- high suspicion

The specialist does not make the final biopsy decision. Its verdict only selects the matching outgoing edge.

Specialist's structured response (example)

Verdict	high_suspicion
Supporting findings	Suspicious imaging features; largest lesion size 22 mm
Variables used	PI-RADS category, largest lesion size
Key supporting evidence	Current imaging report; previous imaging report.
Evidence request (if needed)	None. Requested only when additional evidence could change the selected outgoing edge.
Local rationale	Imaging is suspicious and/or the lesion has grown, meeting criteria for high suspicion (illustrative).

3. Outputs from the completed execution
